

MOUSING AROUND

Mice are sentient beings - meaning they can feel pleasure as well as pain.

Mice have adapted to some of the harshest climates on the planet and are able to survive despite having many predators.

Mice are very social and get lonely if they have to live alone.

Mice are nocturnal. This means they are active at night and sleep during the day.

There are over 30 different species of mice. They can vary in size and colour.

Mice make high-frequency sounds to communicate with each other. These sounds cannot be heard by the human ear!

Mice are very clean and tidy - they will often have burrows with separate spaces for sleeping, keeping food and going to the toilet.

How many mice can you spy?
